                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Searched:
   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Proc. Natl. Acad. Sci. U.S.A. 98:4136-4141(2001).

C -! PUNCTION: Required for cell division and growth It catalyzes the

C phosphorylation of Ctra and activates transcription in vitro of

the cell cycle-regulated flip promoter.

SIBCELIULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OPROQ9; Q9A2S2;

CATALYTIC ACTIVITY: GTP + (5') PP-pur-mRNA = diphospha G(5') PPP-pur-mRNA. 
SUBUNIT: HETERODIMER OF A LARGE AND A SMALL SUBUNIT. 
SIMILARITY: BELONGS TO THE VIRAL GTASE FAMILY.

ALSO CLEAVES COLLAGENS OF TYPES VII AND X. CATALYTIC ACTIVITY: Cleaves preferentially one bond in native collagen. Cleavage of the triple helix of collagen at about three-quarters of the length of the molecule from the N-terminus, at 775-Gly-|-11e<sup>4</sup>776 in the alpha-1(I) chain. Cleaves synthetic substrates and alpha-macroglobulins at bonds where P1' is a budgaranchic collagen.

FUNCTION: HYDROLYZES AGAROSE TO YIELD PREDOMINANTLY

NEOAGAROTETRAOSE AND NEOAGAROHEXAOSE.

CATALYTIC ACTIVITY: Hydrolysis of 1,3-beta-D-galactosidic linkages
in agarose, giving the tetramer as the predominant product.

SIMILARITY: BELONGS TO FAMILY 50 OF GLYCOSYL HYDROLASES.
